IMPLEMENTATION OF SOFTWARE

When it comes to building apps, be it a desktop application, web app, or mobile app, among the first questions the development team should ask you is what the anticipated technology stack looks like. If you don't know, that's OK—the developers should be able to work with you to determine the best approach, considering all the system requirements, tradeoffs and budget.

Too many custom development projects fail because the developers or other stakeholders did not know or fully appreciate the environment in which the software was to be run—specifically, the technology stacks involved. Knowing this at the beginning can inform a robust software architecture and produce a high-performing system that meets everyone's expectations.

Future Prospects

We will need to make an mobile application.

After an year or two we might need to become a single stop not only for COVID-19 but for other diseases and healthcare facilities.
